Project 3 - Example Main Script

Chengliang Tang, Tian Zheng

In your final repo, there should be an R markdown file that organizes **all computational steps** for evaluating your proposed image classification framework.

This file is currently a template for running evaluation experiments of image analysis (or any predictive modeling). You should update it according to your codes but following precisely the same structure.

```
if(!require("EBImage")){
  source("https://bioconductor.org/biocLite.R")
 biocLite("EBImage")
}
## Loading required package: EBImage
if(!require("xgboost")){
  install.packages("xgboost")
}
## Loading required package: xgboost
if(!require("mlr")){
  install.packages("mlr")
## Loading required package: mlr
## Loading required package: ParamHelpers
library("EBImage")
library("xgboost")
library('mlr')
```

Step 0: specify directories.

Set the working directory to the image folder. Specify the training and the testing set. For data without an independent test/validation set, you need to create your own testing data by random subsampling. In order to obain reproducible results, set.seed() whenever randomization is used.

```
set.seed(2018)
# setwd("./ads_fall2018_proj3")
# here replace it with your own path or manually set it in RStudio to where this rmd fil
e is located.
# use relative path for reproducibility
```

Provide directories for training images. Low-resolution (LR) image set and High-resolution (HR) image set will be in different subfolders.

```
train_dir <- "../data/train_set/" # This will be modified for different data sets.
train_LR_dir <- paste(train_dir, "LR/", sep="")
train_HR_dir <- paste(train_dir, "HR/", sep="")
train_label_path <- paste(train_dir, "label.csv", sep="")</pre>
```

Step 1: set up controls for evaluation experiments.

In this chunk, we have a set of controls for the evaluation experiments.

- (T/F) process features for training set
- (T/F) run evaluation on an independent test set
- (T/F) process features for test set

```
run.feature.train=TRUE # process features for training set
run.test=TRUE # run evaluation on an independent test set
run.feature.test=TRUE # process features for test set
```

Step 2: construct features and responses

feature.R should be the wrapper for all your feature engineering functions and options. The function feature() should have options that correspond to different scenarios for your project and produces an R object that contains features and responses that are required by all the models you are going to evaluate later. + feature.R + Input: a path for low-resolution images. + Input: a path for high-resolution images. + Output: an RData file that contains extracted features and corresponding responses

```
source("../lib/feature.R")

tm_feature_train <- NA
if(run.feature.train){
  tm_feature_train <- system.time(dat_train <- feature(train_LR_dir, train_HR_dir))
  feat_train <- dat_train$feature
  label_train <- dat_train$label
}

#save(dat_train, file="../output/feature_train.RData")</pre>
```

Step 3: Train a classification model with training images

Call the train model and test model from library.

train.R and test.R should be wrappers for all your model training steps and your classification/prediction steps. + train.R + Input: a path that points to the training set features and responses. + Output: an RData file that contains trained classifiers in the forms of R objects: models/settings/links to external trained configurations.

- + test.R + Input: a path that points to the test set features. + Input: an R object that contains a trained classifier.
- + Output: an R object of response predictions on the test set. If there are multiple classifiers under evaluation, there should be multiple sets of label predictions.

```
source("../lib/train.R")
source("../lib/test.R")
#source('../lib/supply.R')
```

• Train the model with the entire training set using the selected model (model parameter) via cross-validation.

```
tm_train=NA
tm_train <- system.time(fit_train <- train(feat_train, label_train))</pre>
```

```

                                             test-rmse:0.054381+0.000182
```

```
#save(fit_train, file="../output/fit_train.RData")
```

Step 4: Super-resolution for test images

Feed the final training model with the completely holdout testing data. + superResolution.R + Input: a path that points to the folder of low-resolution test images. + Input: a path that points to the folder (empty) of high-resolution test images. + Input: an R object that contains tuned predictors. + Output: construct high-resolution versions for each low-resolution test image.

```
source("../lib/superResolution.R")
test_dir <- "../data/test_set/" # This will be modified for different data sets.
test_LR_dir <- paste(test_dir, "LR/", sep="")
test_HR_dir <- paste(test_dir, "HR/", sep="")

tm_test=NA
if(run.test){
  #load(file="../output/fit_train.RData")

tm_test <- system.time(MSE<-superResolution(test_LR_dir, test_HR_dir, fit_train))
}
PSNR <- 20*log(1,10)-10*log(MSE,10)</pre>
```

Summarize Running Time

```
Prediction performance matters, so does the running times for constructing features and for training the model,
especially when the computation resource is limited.
 cat("Time for constructing training features=", tm feature train[1], "s \n")
 ## Time for constructing training features= 86.059 s
 \#cat("Time\ for\ constructing\ testing\ features=",\ tm_feature_test[1],\ "s\ \n")
 cat("Time for training model=", tm train[1], "s \n")
 ## Time for training model= 526.709 s
 cat("Time for super-resolution=", tm test[1], "s \n")
 ## Time for super-resolution= 1962.701 s
 cat('MSE is',MSE,'\n')
 ## MSE is 0.002803347
 cat('PSNR is', PSNR)
 ## PSNR is 25.52323
```
